

GROWIFY DIGITAL

ASSOCIATE DATA ANALYST ASSESSMENT

Marketing Performance Analysis, Budget Reallocation & 25% Growth Strategy

Prepared from the supplied Facebook Ads, Google Ads, Shopify sales data and Power BI report.

1. Executive Summary

The objective is to increase sales by 25% without increasing the existing marketing budget. The analysis combines paid-media performance with Shopify sales and uses campaign, ad-set and ad-level evidence to identify where budget can be protected, reduced and scaled.

Current paid-media spend is ₹6.28M. Facebook accounts for approximately 93.7% of spend and generates ₹11.12M of ad-attributed revenue at 1.89x ROAS. Google uses only ₹397.6K but generates ₹2.33M of attributed revenue at 5.86x ROAS. This indicates a material efficiency gap in the current platform mix.

For the growth baseline, Shopify sales are ₹14.30M. A 25% increase requires approximately ₹17.87M, creating a sales gap of ₹3.57M. At unchanged ad spend of ₹6.28M, the required blended sales-to-ad-spend ratio is approximately 2.85x versus the current Shopify-sales-to-ad-spend ratio of 2.28x. Therefore, the growth challenge is fundamentally an efficiency and allocation challenge, not a request for more budget.

A proposed ₹660.2K reallocation from sub-1.5x ROAS campaigns to selected high-performing campaigns produces a directional historical-ROAS projection of approximately ₹3.64M in additional revenue. This is close to, and slightly above, the ₹3.57M Shopify sales gap, but it is not a guarantee because historical ROAS may decline as spend scales.

2. Data & Methodology

The analysis uses three source datasets: Facebook Ads, Google Ads and Shopify sales. Paid-media data was standardized into a common marketing table with Date, Platform, Campaign, Spend, Revenue, Clicks, Impressions and Purchases/Conversions. Shopify data was treated carefully because it is at product/order-line grain rather than a simple one-row-per-order structure.

For campaign decisions, a 'meaningful campaign' filter of at least ₹50,000 spend and at least 10 purchases/conversions was used where appropriate. This reduces the risk of making scaling decisions from extremely small samples. High-ROAS low-spend items are therefore treated as test opportunities rather than automatically promoted to major budget recipients.

ROAS is calculated as $\text{Revenue} \div \text{Spend}$. CTR is $\text{Clicks} \div \text{Impressions}$. CPC is $\text{Spend} \div \text{Clicks}$. CPM is $\text{Spend} \div \text{Impressions} \times 1,000$. Conversion Rate is $\text{Purchases/Conversions} \div \text{Clicks}$. AOV is $\text{Revenue} \div \text{Purchases/Conversions}$.

Important measurement distinction: campaign/platform ROAS in the Marketing table uses ad-attributed revenue. The 25% growth target uses Shopify total sales as the business-sales baseline. These two measures are intentionally kept separate to avoid mixing attribution metrics with actual store sales.

3. Current Performance Snapshot

Metric	Result
Total paid-media spend	₹6.28M
Ad-attributed revenue	₹13.45M
Ad-attributed ROAS	2.14x
Shopify total sales baseline	₹14.30M
25% Shopify sales target	₹17.87M
Current Shopify sales / ad spend	2.28x
Required ratio at unchanged spend	2.85x
Required efficiency improvement	25%

4. Platform Performance

Platform	Spend	Attributed Revenue	ROAS	Share of Spend
Facebook	₹5.88M	₹11.12M	1.89x	93.7%
Google	₹397.6K	₹2.33M	5.86x	6.3%

Finding: Facebook is the dominant spend platform but materially less efficient than Google. Google delivers roughly 3.1x Facebook's ROAS while receiving only a small portion of the budget. The evidence supports testing a higher allocation to proven Google campaigns, while avoiding an uncontrolled migration of all Facebook budget.

5. Campaign Performance & Decision Framework

Decision thresholds used in this assessment:

Decision	ROAS rule	Interpretation
CUT	<1.5x	Revenue is only ₹1.50 or less per ₹1 spent; materially weak versus the blended benchmark and a clear candidate for reallocation.
HOLD	1.5x–2.0x	Positive return but below the current blended marketing efficiency; maintain while optimizing.
SCALE	>2.0x	Above the current 2.14x ad-attributed blended ROAS; scale only when spend and conversion volume also provide evidence.

These are management decision thresholds, not profitability thresholds. Gross margin, contribution margin and a formal target CAC were not supplied, so ROAS alone cannot establish net profitability.

6. Key Campaign Winners

Campaign	Spend	Conversions/ Purchases	ROAS	Decision
Google – LuxuryP Search India 12/12/25	₹71.7K	69.46	12.08x	SCALE
Google – LuxuryP Search INT 5/21/26	₹58.0K	25.04	9.37x	SCALE
Google – P.max HP EOSS India	₹91.0K	45.34	6.40x	SCALE
Facebook – MOF & BOF Sale India + intl	₹1.57M	279	2.28x	SCALE
Facebook – TOF Sales India Open	₹369.4K	75	2.12x	SCALE
Facebook – TOF Sale	₹296.1K	22	2.21x	SCALE

US				
Facebook – TOF Sales Australia EOSS	₹199.7K	13	2.15x	SCALE

The Google winners are particularly important because their ROAS is high with meaningful spend and conversion volume. The large Facebook MOF campaign is also strategically important because its 2.28x ROAS is supported by 279 purchases, making it a stronger scaling candidate than tiny campaigns showing extreme ROAS.

7. Key Campaign Losers / Holders

Campaign	Spend	Purchases/ Conversions	ROAS	Decision
Facebook – INT Direct	₹423.4K	17	1.11x	CUT
Facebook – CA Direct	₹419.9K	22	1.63x	HOLD
Facebook – TOF Sale India	₹372.3K	30	1.63x	HOLD
Facebook – India Direct	₹1.27M	270	1.77x	HOLD
Facebook – India LAL	₹220.8K	54	1.79x	HOLD
Facebook – US Direct	₹513.7K	29	1.97x	HOLD

The most immediate campaign-level cut candidate is INT Direct at 1.11x ROAS on ₹423K of spend. Other sub-2x campaigns are not necessarily failures; they are HOLD candidates because they still generate sales and have meaningful conversion volume.

8. Ad Set & Ad Audit

The ad-level audit shows substantial inconsistency. Several ads demonstrate strong efficiency at manageable spend, while other ads consume meaningful budget below 1.0x ROAS. This suggests that budget should be moved toward proven creative/offer combinations rather than simply increasing every campaign uniformly.

Ad / Creative	Spend	Purchases	ROAS
India Direct – Campaign Shoot EOSS CLP	₹13.3K	7	7.95x
MOF+BOF India – Flexible Campaign Shoot	₹36.3K	18	7.95x
TOF US – Bridal Vaisakhi	₹30.0K	5	6.15x
MOF INT – EOSS CLP Event	₹25.4K	4	5.85x
MOF India – Catalogue Carousel Top Selling Products	₹140.8K	44	3.72x

Weak examples include Catalog Intro Flat 40% at 0.27x ROAS, Catalogue Carousel Flat 40% in the international MOF/BOF setup at 0.42x, and Custom Carousel Special Prices at 0.56x. These are evidence-based candidates for pause/rework, subject to the campaign's delivery and attribution context.

9. Top 3 Scaling Blockers

Blocker 1 — Excessive spend concentration in lower-efficiency Facebook

Problem: the current mix is heavily concentrated in Facebook despite lower blended efficiency.

Evidence: Facebook receives approximately 93.7% of paid-media spend but produces 1.89x ROAS, versus Google's 5.86x ROAS.

Possible cause: the budget mix appears to have remained concentrated in Facebook despite stronger returns from selected Google campaigns. This is an inference from performance data, not proof of the historical budgeting process.

Action: progressively reallocate budget toward proven Google campaigns and the strongest Facebook campaigns, with guardrails against diminishing returns.

Blocker 2 — Budget trapped in weak campaigns and ads

Problem: a meaningful pool of spend is producing less than 1.5x ROAS.

Evidence: the identified cut pool is approximately ₹660.2K. The Facebook INT Direct campaign alone spends about ₹423.4K at 1.11x ROAS. Multiple ads also record ROAS below 1.0x.

Possible cause: inefficient creative, audience, offer or campaign configuration. The dataset does not prove which of these is responsible for every weak ad.

Action: pause/cut the weakest spend, preserve learning where appropriate, and move the released budget into proven campaigns and structured tests.

Blocker 3 — Large gap between creative winners and losers

Problem: creative-level performance is highly uneven, limiting confidence in broad budget increases.

Evidence: some ads exceed 5x ROAS while other ads with meaningful spend are below 1x ROAS. For example, the Flexible Campaign Shoot and EOSS CLP examples are around 7.95x and 5.85x, while several Flat 40% / Special Prices creatives are below 0.7x.

Possible cause: creative/offer/audience fit differences; fatigue or saturation should be investigated rather than assumed.

Action: build a controlled creative testing system, replicate winning formats, and scale winners gradually rather than increasing budgets across the entire account.

10. Budget Reallocation Plan

The plan keeps total marketing spend unchanged at approximately ₹6.28M. Approximately ₹660.2K is removed from sub-1.5x ROAS candidates and redistributed to six selected scale candidates.

Scale Campaign	Approx. Current Spend	Additional Budget	Reason
Google – LuxuryP Search India 12/12/25	₹71.7K	₹165.1K	12.08x ROAS with 69.46 conversions
Google – P.max HP EOSS India	₹91.0K	₹132.0K	6.40x ROAS with 45.34 conversions
Facebook – MOF & BOF India + intl	₹1.57M	₹132.0K	2.28x ROAS with 279 purchases
Facebook – TOF Sales India Open	₹369.4K	₹99.0K	2.12x ROAS with 75 purchases
Facebook – TOF Sale US	₹296.1K	₹66.0K	2.21x ROAS with 22 purchases
Facebook – TOF Sales Australia EOSS	₹199.7K	₹66.0K	2.15x ROAS with 13 purchases
TOTAL	—	₹660.2K	Budget reallocated, not added

At the historical ROAS of the selected campaigns, the reallocated ₹660.2K produces a directional projected additional revenue of approximately ₹3.64M. This is a scenario estimate; it assumes historical efficiency can be retained as spend increases and therefore must be validated through controlled scaling.

11. 25% Sales Growth Strategy

Current Shopify sales are ₹14.30M. The 25% target is ₹17.87M, requiring approximately ₹3.57M of additional sales. With ad spend held at ₹6.28M, the required sales-to-ad-spend ratio rises from approximately 2.28x to 2.85x. The required efficiency improvement is therefore 25%.

Lever	Execution	Success Check
Budget reallocation	Move ₹660.2K from <1.5x campaigns into proven Google/Facebook winners.	Blended efficiency improves without increasing total spend.
Google scaling	Increase budgets gradually on top Search/PMAX campaigns; expand only where query/product economics remain strong.	ROAS remains above a defined guardrail after scaling.
Creative replication	Create variants of Flexible Campaign Shoot, EOSS CLP and strong catalogue/product formats.	New variants approach or exceed campaign baseline ROAS/CTR.
Weak creative reduction	Pause or redesign repeatedly sub-1x creatives.	Released spend is redeployed to stronger ads.
Landing/PDP testing	Test product-page messaging, offer presentation and checkout friction.	Conversion rate improves while CPC remains stable.
Controlled scaling	Increase winning campaign budgets in measured steps rather than large jumps.	No material efficiency deterioration after each scale step.

12. Recommended Testing Framework

- 1) Budget test: increase selected winners by roughly 10–20% per scaling step and evaluate on a consistent 7-day window. Protect campaigns if ROAS deteriorates materially.
- 2) Creative test: launch multiple variants of the strongest concepts with different hooks, product selections and offer framing. Use CTR as an early diagnostic but judge the final winner on conversion and ROAS.
- 3) Landing-page test: compare the current product/collection experience against a focused version. The success criterion should be higher conversion rate without a disproportionate increase in CPC.
- 4) Google expansion test: increase spend on the strongest Search/PMAX campaigns first, then expand only after efficiency remains stable. Do not assume that the current extreme ROAS will remain constant at much larger budgets.

13. Data Limitations & Quality Notes

- Shopify data is at product/order-line grain. Order ID is not a unique order key in the raw data, so the analysis used the order-level structure rather than blindly summing repeated order-level sales across every product row.
- Google conversions can be fractional because the source uses attributed conversion values rather than necessarily whole-number orders. They are therefore interpreted as conversions in paid-media reporting.

- Facebook contains missing values in several funnel-event fields, including Checkouts Initiated and Adds of Payment Info. Funnel conclusions should therefore focus on the fields with reliable coverage.
- Ad-platform revenue is attribution-based, while Shopify sales are store-level sales. The report keeps these measures separate and does not present them as interchangeable.
- No gross margin, contribution margin or target CAC was supplied. Consequently, ROAS thresholds are decision rules for this assessment, not a complete profitability model.

14. Power BI Report Deliverable

The accompanying Power BI report contains six analytical pages:

Page	Purpose
Executive Overview	Management-level spend, revenue, ROAS, purchases, AOV and platform/campaign overview.
Platform Performance	Comparison of Facebook and Google spend, revenue, ROAS and purchases.
Campaign Performance	Campaign-level spend, revenue and ROAS with filtering.
Ad Set & Ad Audit	Facebook ad-set/ad audit using the dedicated Facebook analysis table.
Funnel & Efficiency	Impressions, clicks, purchases, revenue and efficiency KPIs.
Budget Reallocation & Growth	25% growth target, required ROAS/efficiency, proposed budget shifts and projected impact.

15. Key DAX Measures Used

- Total Spend = SUM(Marketing[Spend (INR)])
- Total Revenue = SUM(Marketing[Revenue (INR)])
- ROAS = DIVIDE([Total Revenue], [Total Spend])
- Total Purchases = SUM(Marketing[Purchases])
- Total Clicks = SUM(Marketing[Clicks])
- Total Impressions = SUM(Marketing[Impressions])
- CTR = DIVIDE([Total Clicks], [Total Impressions])
- Cost per Click = DIVIDE([Total Spend], [Total Clicks])
- CPM = DIVIDE([Total Spend], [Total Impressions]) * 1000
- Conversion Rate = DIVIDE([Total Purchases], [Total Clicks])
- AOV = DIVIDE([Total Revenue], [Total Purchases])
- Ad ROAS = DIVIDE(SUM(Facebook_analysis[Revenue (INR)]), SUM(Facebook_analysis[Spend (INR)]))

16. Management Conclusion

The account has a credible path toward the 25% sales objective without increasing the marketing budget, but the target should be treated as a performance goal rather than a guaranteed outcome. The strongest evidence is the large efficiency difference between Google and Facebook, the identifiable ₹660.2K low-efficiency budget pool, and the presence of high-performing campaigns and creatives that currently operate at relatively modest spend.

The recommended operating model is to cut or reduce persistently weak spend, reallocate into proven winners, scale gradually, and continuously test creative and landing-page improvements. The historical-ROAS scenario suggests approximately ₹3.64M of incremental revenue from the proposed reallocation, but diminishing returns must be monitored closely.

Success should ultimately be judged by whether Shopify sales reach or approach ₹17.87M while total ad spend remains around ₹6.28M and the required efficiency level of approximately 2.85x is achieved.
